The purpose of this document is to clearly define the data that is needed to achieve project objectives and ensure that all stakeholders understand the data requirements.

Purpose

The purpose of this document is to outline the data requirements for the development of a Customer Relationship Management (CRM) system for USAFIRI. This document will serve as a guide for the stakeholders to ensure that all necessary data is captured and integrated into the system.

Data Sources

USAFIRI supports importation of spatial data layers from various sources:

- OSM
- WMS
- Field

Data Themes

USAFIRI has built-in standard data themes by default. Following are the five data themes:

- Baseline
  Baseline data is primarily secondary data that is required as context or as analysis input to the project. These layers typically include administrative boundaries and topographic data. Built environment data is also recommended, using secondary sources, such as OSM or Microsoft buildings. The project boundary is, by default, set under the baseline.
- Transportation Obstacles
  Barriers to transportation are typically integrated as points. These points require to be snapped to the transportation network to be used in analysis. Alternativeley, barriers could be included as attributes to the transportation network.
- Transportation Network
  The transportation network refers to a set of connected lines representing roads and paths. Lines need to be snapped for the network to be functional.
- Transportation Utilities
  The utilities under transportation sector such as cycle shops, vehicle repair shops, cycle rack, etc fall under transportation utilities.
- POI
  Education, health and government facilities should normally systematically be included in the data collection. It is generally recommended to include businesses and religious sites, although not necessarily in all contexts and scales.

Category	Data layer	Data_Layer_Sub_ Types	Data Type
Baseline	Admin		Polygon
	Study Area Polygon		Polygon
	LULC		Polygon /raster
	DEM		Raster
Transportaion Network	Road Network		Line data
Transport_Utiltiies	Road Treatment, Roadside Amenities, Street Lights		Point Data
	Street profiles		Point Data
Transport_ Barrier	**Infrastructure Barriers**	1.Damaged infrastructure 2.Excessive traffic 3.Open sewage 4.Improper parking 5.Unmaintained paving 6.Unmanaged street vendors 7.Water logged area	Point data
	Road incidents	1.Road crash 2.Animal attack 3.Physical attack	Point data
	Crime or Wrongdoing	1.Harassments 2.Physical agressions 3.Substance abuse	Point data

POI	Points of interests will be selected according to the community participants' inputs of their importance in their daily life. The might include the following:Local business /Market/ Retail Centre/Commercial Trade Markets and commercial centres, Community Water Points, Public spaces, Commerce, Non Governmental Organizations , Community based organizations, Security Forces, Industries and Factories, Mining Area, Water resources, Tourist Sites, Sea Ports, Bridges Religious sites, Recreational Centres, Farms, Mass Transit,Helipads and Airports, Public Toilets, Fuel Stations,Finance, Banks, Co-operatives, IME, Money Transfer	***Other POIs can be added based on the local context***	Point data
Health	Pharmacy, Clinic, Health Posts, Hospitals etc.	urban health centre, village clinic	Point data
Education	Kindergarden, Primary School, University, Training Center etc.	child service centre	Point data

Government	Local, State, District, Country, other Government office etc.		Point data

Data Template

A data template is a pre-designed structure or format that is used to organize and present data in a consistent and standardized way. It is essentially a framework that specifies the fields, labels, and data types that are required for a particular type of data.

USAFIRI provides a set of standard data template for a list of data layers. This helps in assisting the data collectors to fetch necessary attributes so that the user can have access to maximum efficiency of system and its functionalities.
